

1. What is the key difference between publishing a dashboard on Tableau Public versus Tableau Server/ Cloud in terms of accessibility and data security?

Ans:

Tableau Public

Accessibility:

Anyone on the internet can view the dashboard.

Data Security:

Not suitable for confidential or sensitive data because workbooks and underlying data

Tableau Server / Cloud

Accessibility:

Only authorized users (or users you explicitly share with) can access the dashboard.

Data Security:

Supports authentication, permissions, role-based access, and secure connections, making it

Tableau Public

may be publicly accessible.

Tableau Server / Cloud

appropriate for business and sensitive data.

2. When publishing a Tableau dashboard, what happens to a live connection compared to an extract? How does this affect data refresh and performance?

Ans:

Aspect	Live Connection	Extract
Data Source	Connects directly to the original database every time the	Uses a snapshot (copy) of the data stored

Aspect	Live Connection	Extract
Data Refresh	dashboard is opened or refreshed .	in Tableau.
	Always shows the most current data from the source. No separate refresh is needed.	Data remains unchanged until the extract is refreshed manually or through

Aspect	Live Connection	Extract
Performance	Can be slower because queries are sent to the database each time. Performance depends on the database	a scheduled refresh.
		Usually faster because Tableau queries the local extract instead of the live database.

Aspect	Live Connection	Extract
Server Load	and network speed.	Reduces load on the source database since Tableau uses the extracted data.
	Places load on the source database whenever users interact with the dashboard.	

Effect on Data Refresh

- **Live Connection:** Updates automatically and reflects real-time changes in the source data.

- **Extract:** Requires scheduled or manual refreshes to keep the dashboard data up to date.

Effect on Performance

- **Live Connection:** May experience slower response times if the database is large, busy, or network connectivity is poor.
- **Extract:** Generally provides faster dashboard performance because the data is optimized and stored within Tableau.

3. In Tableau Server or Cloud

(conceptually), which feature allows administrators to control which users can view, interact with, or edit a published dashboard?

Ans: In **Tableau Server** or **Tableau Cloud**, administrators use **Permissions and User Roles** to control who can view, interact with, or edit a published dashboard.

Key Feature: Permissions

Permissions can be set at the **project, workbook, dashboard, or data source** level to determine what actions users are allowed to perform.

Common permission capabilities include:

- **View** dashboards and reports
- **Interact** with filters, parameters, and visualizations
- **Download** data or workbooks
- **Edit** workbooks and dashboards
- **Publish** new content
- **Manage** permissions and content

User Roles

Tableau also provides roles such as:

- **Viewer** – Can view and interact with dashboards.
- **Explorer** – Can view, interact, and perform limited editing.
- **Creator** – Can create, edit, and publish dashboards and data sources.

- **Administrator** – Has full control over content, users, and permissions.
- 4. **If you want users to view a dashboard but not download the underlying data, which permission setting would you adjust in Tableau Server?**

Ans: To allow users to **view a dashboard but prevent them from downloading the underlying data**, you would adjust the **Download Data permission** in Tableau Server/Cloud.

Steps (Conceptually)

1. Open the dashboard/workbook permissions.
2. Grant users or groups the **View** permission.
3. Deny or remove permissions such as:
 - **Download Full Data**
 - **Download Summary Data**
 - **Download Workbook** (if applicable)

Result

- Users can **open and interact with the dashboard**.
- Users **cannot download the underlying data** from the visualizations.

5. Name two methods by which a Tableau dashboard can be embedded into a web page or website.

Ans: Two common methods to embed a Tableau dashboard into a web page or website are:

Embed Code (iFrame)

- Tableau provides an HTML embed code when a dashboard is published to Tableau Server, Tableau Cloud, or Tableau Public.
- The code is pasted into the website's HTML page, allowing the dashboard to appear directly on the webpage.

Tableau JavaScript Embedding API

- Developers can use Tableau's embedding/API capabilities to

integrate dashboards into web applications.

- This method provides more control over dashboard behavior, such as filtering, resizing, responding to user actions, and customizing the user experience.

6. List two best practices you should follow when preparing a dashboard for public sharing to ensure data security and privacy.

Ans: Remove or Anonymize Sensitive Data

- Ensure the dashboard does not contain confidential information such as personal details, customer records, email addresses, phone numbers, financial data, or other sensitive business information.
- Use aggregated or anonymized data whenever possible.

Review Permissions and Data Access Settings

- Verify that users can only access the information intended for public viewing.
- Disable permissions that allow downloading underlying data or workbooks if that information should not be shared.

7. After publishing a dashboard, users report a “Data not found” error. What is the most common cause related to data source settings?

Ans: The most common cause of a "**Data not found**" error after publishing a Tableau dashboard is that the **published workbook cannot connect to its data source**.

Common reasons include:

- The data source file (Excel, CSV, etc.) was **not included** when publishing.

- The **database connection details** are **incorrect** or have changed.
- The Tableau Server/Cloud does not have access to the data source location.
- Required **credentials were not embedded** or are invalid.

8. When embedding a Tableau dashboard into a secure internal portal, what two additional security measures should be implemented to ensure only authorized users can access the embedded content?

Ans: When embedding a Tableau dashboard into a secure internal portal, two important security measures are:

User Authentication (Single Sign-On or Login Authentication)

- Require users to authenticate before accessing the portal and Tableau content.
- Use methods such as **SSO (Single Sign-On)**, SAML, OAuth, Active Directory, or

Tableau authentication to verify user identities.

Role-Based Permissions and Access Control

- Configure Tableau Server/Cloud permissions so that only authorized users or groups can view, interact with, or edit the dashboard.
- Assign appropriate roles (Viewer, Explorer, Creator, etc.) and restrict access to sensitive content.
